

Water stewardship and resource efficiency

Water remains a crucial resource for Lamberti, both for production processes and for the ecosystems in which manufacturing sites operate. For this reason, water management is addressed through dedicated procedures and continuous monitoring across all facilities.

All manufacturing sites comply with specific standards for water discharge management. The effectiveness of these measures is reflected in the Group's water consumption data, which shows a consistent reduction over the past five years.

Since the first Sustainability Report published in 2020 (with data referring to 2019), **Lamberti has achieved a 42% reduction in water use, decreasing total consumption from 499.4 ML to 289.1 ML in 2024.**

Water consumption trend

Year	Water consumption in million liters
2020	534.2
2021	483.6
2022	467.0
2023	380.4
2024	289.14

In addition to monitoring water withdrawal and discharge, Lamberti finalized a Water Reuse Plan in 2024 for its three main Italian manufacturing sites. The plan defines priorities and actions that have begun to be implemented in 2025, reinforcing the Group's commitment to efficient water use.
